

# Molded End Seal

## Installation Instruction

Molded end seals are designed to provide a barrier to seal the space between the Carrier and Casing pipes in an installation. While they provide an effective barrier to the intrusion of debris and other items, they are not intended to perform as a pressure seal.

1. Verify size of the end seal
2. Place end seal on to the carrier pipe.
3. After installing the carrier pipe in the casing, the seals are secured using stainless steel bands (provided with each seal).
4. Wrap the stainless bands around their respective pipes and tighten worm gear using a screwdriver or an 8 mm/5/16" nut driver.
